A. Personal Statement

I have expertise in molecular and cellular biology acquired during my PhD working with *Leishmania* parasites at the Institute of Tropical Medicine in Antwerp, Belgium and since 2003 my research is focused on Malaria. We conduct multidisciplinary malaria projects, which span from basic microscopy to specialized laboratory techniques (i.e., genotyping by microsatellites and SNPs, next generation sequencing, among others) including field work in rural remote areas in the Peruvian Amazon region. Currently, I am the Project co-leader of the Peruvian epidemiology component (Project 1) of the U19 Amazonian International Center of Excellence in Malaria Research (Amazonia-ICEMR) focused on getting scientific evidence with a multidisciplinary approach contributing with the Peruvian Minister of Health in the goal to control and eliminate malaria. I am also active as mentor of undergraduate / postgraduate students and junior faculty / early career researchers, and I was also a Co-Director of a Fogarty International Center/NIH Global Infectious Diseases Training program (PI: JM Vinetz) and Coordinator of a PhD program in Life Sciences financed by the Peruvian National Council of Science. 2. A better understanding of malaria transmission is also required to design new and better strategies to control and, eventually, to eliminate this disease. I have participated and lead several projects outside and within the Amazonian-ICEMR identifying and validating new serological markers used to describe the transmission patterns across time and space.

4. Most of our work in malaria was focused to identify submicroscopic and asymptomatic infected people using molecular biology techniques. However, these techniques are difficult to implement at point of care. Much of my research has been focused on the development of a better and a faster way to detect Malaria parasites.
